RFID (Radio Frequency Identification Devices)

Always evolving

Innovative technology that consists of a system for storing and remotely retrieving data using devices called tags (labels). It is the latest in RFID contactless technology.

The tag can store and retrieve information for identifying persons, animals or things.

Impaorsa also offers a large market of documents with the application of NFC (Near Field Communication) technology protocol based on a wireless interface. Communication takes place between two entities and allows for financial transactions, mobile marketing (the internet of things), ticketing, etc.

Our solution consists of the inclusion of a device attached to any of our products, especially on the integrated documents.

What is its scope of application?

- Access control.
- Control and identification of vehicles in controlled parking.
- Registration and tracking of luggage.
- Quality control.
- Anti-theft system.
- Control of parcel or courier services.
- Stock and inventory control.

Advantages

- Protected system: it is not sensitive to dirt, can be read simultaneously and has read various angles.
- Does not need direct visibility as do other systems.
- It allows you to modify, add or delete stored information.
- Maximum security, thus preventing counterfeiting.
- Convenience and speed in use: thanks to radiofrequency, it allows for an automatic reading system with the possibility of mass readings.
- Resistant to harsh, aggressive environments and aggressive (humid or low temperatures, etc.)
